Q2. Solve the following with Forward chaining or backward chaining or resolution (any one) use predicate logic as language of knowledge representation clearly specify the Facts & inference rule used.

Example 1.

- 1) Every child sees some witch. No witch has both a black cat & a pointed hat.
- 2) Every witch is good or bad.
- 3) Every child who sees any good witch gets candy.
- 4) Every witch with that is bad has a black cat.
- 5) Every witch that is seen by any child has a pointed hat.
- 6) Prove: Every child gets candy.

→ A) Facts into FOL.

$$1) \exists x \forall y (\text{child}(x), \text{witch}(y) \rightarrow \text{sees}(x, y)) \\ \quad \forall y (\text{witch}(y) \rightarrow \text{has}(y, \text{black cat}) \wedge \text{has}(y, \text{pointed hat}))$$

$$2) \forall y (\text{witch}(y) \rightarrow \text{good}(y) \vee \text{bad}(y))$$

$$3) \exists x (\text{sees}(x, y) \rightarrow (\text{witch}(y) \rightarrow \text{good}(y)) \rightarrow \text{get}(x, \text{candy}))$$

$$4) \forall y ((\text{witch}(y) \rightarrow \text{bad}(y)) \rightarrow \text{has}(y, \text{black hat}))$$

$$5) \forall y (\text{sees}(x, y) \rightarrow \text{has}(y, \text{pointed hat}))$$

B) FOL into CNF

$$\rightarrow \exists x \forall y (\text{child}(x), \text{witch}(y) \rightarrow \text{sees}(x, y))$$

$$\rightarrow \forall y (\text{witch}(y) \rightarrow \text{has}(y, \text{black hat})).$$

- $\rightarrow \neg \exists y (\text{witch}(y) \rightarrow \text{has}(y, \text{pointed hat}))$   
 $\rightarrow \forall y (\text{witch}(y) \rightarrow \text{good}(y))$   
 $\exists y (\text{witch}(y) \rightarrow \text{bad}(y))$   
 $\exists x \exists y [(\text{sees}(x, y) \rightarrow \text{witch}(y) \rightarrow \text{good}(y)) \rightarrow \text{gets}(x \text{ and } y)]$   
 $\rightarrow \exists x \exists y [\text{seen}(x, y) \rightarrow \text{good}(y)]$   
 $\forall y [\text{bad}(y) \rightarrow \text{has}(y, \text{black hat})]$   
 $\exists y [\text{seen}(x, y) \rightarrow \text{has}(y, \text{pointed hat})]$   
 $\rightarrow \neg \forall y [\text{seen}(x, y) \rightarrow \text{has}(y, \text{black hat})]$

c)

$\text{sees}(x, y) \quad \text{|| जानती हैं भावता} \quad \text{witch}(y) \vee \text{seen}(x, y)$

{ good v badly }

$\neg \text{seen}(x, \text{good}) \wedge \neg \text{seen}(x, \text{bad})$

has(y, 2)

{ y/good v bad }

{ z/black cat v  
pointed hat }

$\text{seen}(x, \text{good}) \vee \text{seen}(x, \text{bad})$

has good pointed hats  
v get(x, candy \$)

$\text{seen}(x, \text{good}) \vee \text{has}(\text{good},$   
pointed hats) v gets  
(x, candy)

$\text{seen}(x, \text{good}) \vee$   
gets(x, candy \$)

gets(x, candy)

gets(x, candy)

2) Example 2:-

- 1) Every boy or girl is a child.
- 2) Every child gets a doll or a train or a lump of coal.
- 3) No boy gets any doll.
- 4) Every child who is bad gets any lump of coal.
- 5) No child gets a train.
- 6) Ram gets lump of coal.
- 7) Prove 'Ram is bad.'

- 1)  $\forall x (\text{boy}(x) \text{ or } \text{girl}(x)) \rightarrow \text{child}(x)$
- 2)  $\forall y (\text{child}(y)) \rightarrow \text{gets}(y, \text{doll}) \text{ or } \text{gets}(y, \text{train}) \text{ or } \text{gets}(y, \text{coal})$ .
- 3)  $\forall w (\text{boy}(w)) \rightarrow \neg \text{gets}(w, \text{doll})$
- 4) For all  $z (\text{child}(z) \text{ and } \text{bad}(z)) \rightarrow \text{gets}(z, \text{coal})$ .  
 By child( $y$ )  $\rightarrow \neg \text{gets}(y, \text{train})$ .
- 5)  $\text{child}(\text{ram}) \rightarrow \text{gets}(\text{ram}, \text{coal})$ .  
 To prove  $(\text{child}(\text{ram}) \rightarrow \text{bad}(\text{ram}))$

CNF clauses

- 1)  $\neg \text{boy}(x) \text{ or } \text{child}(x)$ .
- 2)  $\neg \text{girl}(x) \text{ or } \text{child}(x)$ .
- 3)  $\neg (\text{child}(y) \text{ or } \text{gets}(y, \text{doll})) \text{ or } \text{gets}(y, \text{train}) \text{ or } \text{gets}(y, \text{coal})$ .
- 4)  $\neg \text{boy}(w) \text{ or } \neg \text{gets}(w, \text{doll})$
- 5)  $\neg (\text{child}(z) \text{ or } \neg \text{bad}(z) \text{ or } \text{gets}(z, \text{coal}))$
- 6)  $\neg \text{child}(\text{ram}) \rightarrow \text{gets}(\text{ram}, \text{coal})$
- 7)  $\text{bad}(\text{ram})$

Resolution:

4) !child (2) or !bad (2) gets (2, coal)

5) bad (ram)

7) !child (ram) or gets (ram, coal)

Substituting 2 by ram.

7) (a) !boy (x) or child (x)  
boy (ram).

8) child ram (Substituting x by ram).

7) !child (ram) or gets (ram, coal)

8) child (ram)

9) gets (ram, coal)

2) !child (y) (or gets (or gets (y, doll) or gets  
(y, train) or gets (y, train) or gets (y, coal))

8) child (ram)

10) gets (ram, doll) or gets (ram, train) or gets  
(ram, coal).

• (Substituting y by ram).

9) gets (ram, coal)

10) gets (ram, doll) or gets (ram, train) or gets  
(ram, coal).

11) gets (ram, doll) or gets (ram, coal)

8) ! boy (w) or ! gets (w, doll)

5) boy (ram)

12) !get (ram, doll) (Substituting w by ram)

11) gets (ram, doll) or gets (ram, train).

12) ! gets (ram, doll)

13) gets (ram, coal)

6) <9> gets (ram, coal).

13) gets (ram, coal)

Hence bad (ram) is proved.

Q2. Differentiate between STRIPS and ADL.

STRIPS language

ADL.

1) Only allow positive literals  
in the states For eg:

A valid sentence is STRIPS  
is expressed as

$\Rightarrow$  Intelligent  $\wedge$  Beautiful

2) STRIPS stand for standard  
research Institute problem  
solver.

3) Makes use of closed  
world assumption (i.e.) an  
mentioned literals are false.

4) We only can find  
ground literal in goals  
For eg;

Intelligent  $\wedge$  Beautiful.

5) Goals are conjunctions  
For eg:- Intelligent  $\wedge$   
Beautiful)

1) Can support both positive  
& negative literals.

For eg:- Some sentence  
is expressed as  $\Rightarrow$   
stupid  $\wedge$  ugly.

2) Stands for Action  
Description language.

3) Makes use of open world  
Assumption (i.e.) unmentioned  
literals are unknown.

4) We can find qualified  
variable in goal  
For eg:  $\exists x A + (P_1 x) \wedge$   
 $A + (P_2 x)$  is the goal  
of having  $P_1$  &  $P_2$  in  
the same place in the  
example of blocks.

5) Goals may involve  
conjunctions & disjunctions  
For eg:-  
(Intelligent  $\wedge$  (Beautiful  
 $\wedge$  Rich)).

8) Effects are conjurations

7) Does not support equality.

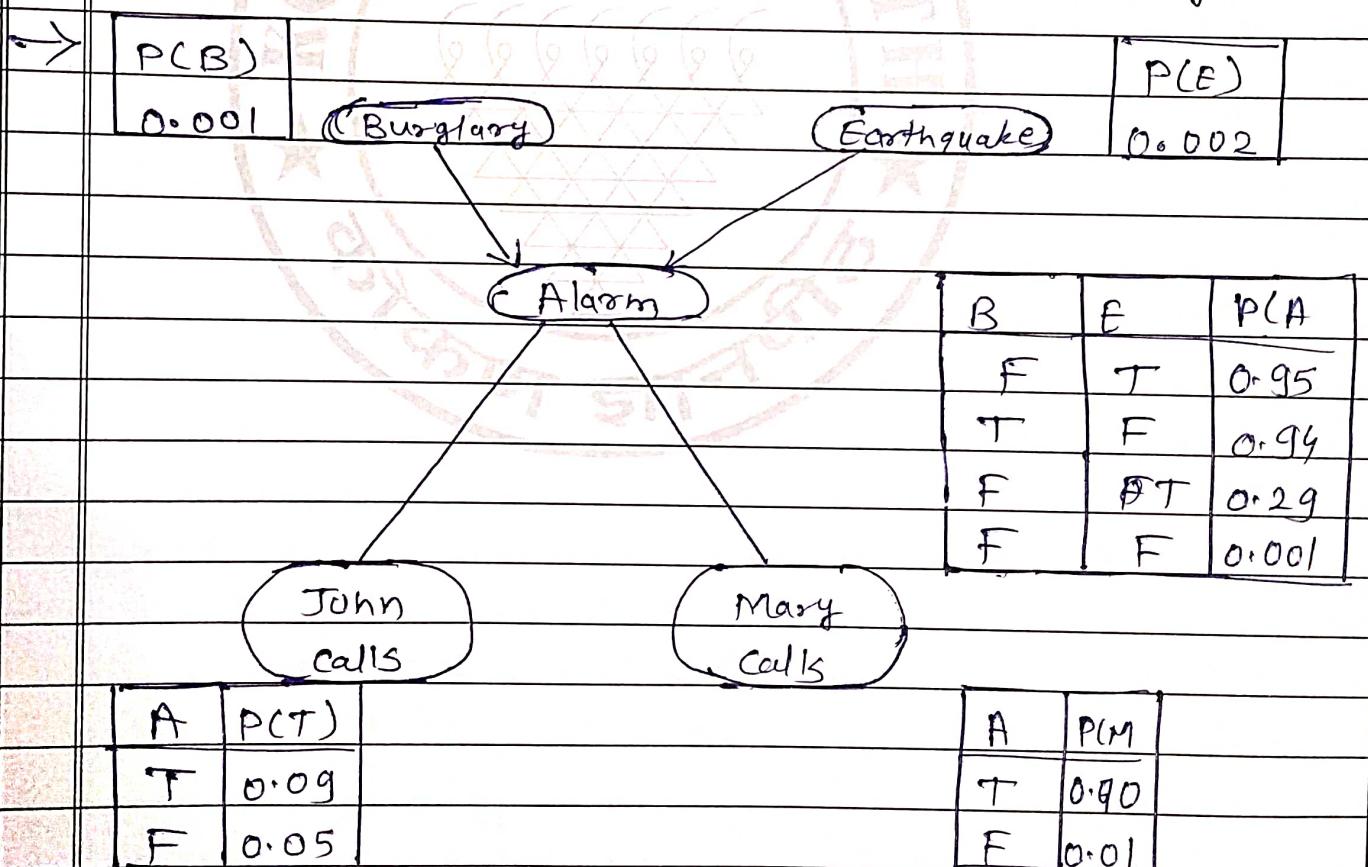

8) Does not have support for types

6) conditional effects are allowed: when  $P; E$  means  $E$  is an effect only if  $P$  is satisfied

7) Equality predicate  $(x = y)$  is build in.

8) support for types  
for eg: The variable  $P$ : person.

Q4. You have two neighbors J and M, who have promised to call you at work when they hear the alarm. J always calls when he hears the alarm, but sometimes confuses telephone ringing with alarms & calls them too. M likes loud music and sometimes misses the alarm together given the evidence of who has or has not called we would like to estimate the probability of burglary. Draw a Bayesian network for this domain with suitable probability tables.

- ① The topology of the network indicates that - Burglary and earthquake affect the probability of the alarm going off.

- Whether John and Mary call depends only on alarm
- They do not perceive any burglaries directly they do not notice minor earthquakes and they do not confer before calling.
- 2) Mary listening to loud music & John confusing phone ringing to sound of alarm can be read from network only implicitly as uncertainty associated to calling at work.
- 3) The probability actually summarizes potentially infinite set of circumstances.
- The alarm might fail to go off due to high humidity, power failure, dead battery, etc arises a dead mouse stuck inside the bell, etc.
- John and Mary might fail to call report & alarm because they are out to junk an vacation temporarily deaf, passing helicopter, etc.
- 4) The condition probability tables in AIP gives probability for values of random variable depending on combination of values for the parent nodes.
- 5) Each row must sum to 1 because entries represent exhaustive set of cases of variables.
- 6) All variables are Boolean.
- 7) In general a table for a Boolean variable with K parents contain 2 independently specific probabilities.

9) Every entry in full joint probability distribution can be calculated from information in Bayesian network.

10) A generic entry in joint distribution is probability of a conjunction of particular assignments to each variable  $p(x_1=x_1, n \dots n \dots x_n=x_n)$  abbreviated as  $p(x_1, \dots, x_n)$ .

11) The value of this entry is  $(P(x_1, \dots, x_n)) = \prod_{i=1}^n P(x_i | \text{parents}(x_i))$ , where  $\text{parents}(x_i)$  denotes the specific values of the variable parents ( $x_i$ ).  
 $= P(j|a) P(m|a) P(alarm|b,a) P(s|b) e(c,s)$   
 $= 0.09 \times 0.07 \times 0.001 \times 0.999 \times 0.9998$   
 $= 0.00628$

12) Bayesian network.
